
DSC API

Introduction

A service that returns one or more DSC reports given a site and a time range.

Base URL

<https://api.netnod.se/dsc/v1/..>

Authentication

With the access you need a new authentication token. Please send an email to ops@netnod.se together with your public PGP and we will provide you with a new token, in an encrypted email.

NB! This token is a shared secret between you and the API server. Be careful handling this token so it doesn't come in the wrong hands.

Add a token authorization header to your requests. Example:

```
Authorization: Token ea721a88312bc41241765b701cb2507a7178e63981412
dd3f4a695 dc071b9b87
```

Resources

Resource	Methods	Description
dsc	GET GET	Get DSC data.
sites/configured	GET	Get list of configured sites.
sites/available		Get list of sites with statistics.

dsc

Resource URL

```
/dsc/:site/:time
```

Method

```
GET
```

URL Parameters

Parameter	Description	Example value
site	Name of the DNS site	STH
time	Time asked for, in UTC	2017072212

time can be specified in two different ways:

Time format	Description	Example value
YYYYMMDDHH	Specified hour	2017072212
YYYYMMDDHHmm	Specified minute	201706221200

When requesting hourly statistics, the result is a concatenation of minutes enclosed within `<dscdata>...</dscdata>`, thus identical to requesting once per minute in terms of raw data. To get the full hour, start time should not be the current hour.

If a *204 - No Content* status code is returned for an endpoint, it only means that there is no data available *right now*. A later retry for a site at the given timestamp may return data if there was activity then.

This is due to the fact that some sites are hosted in remote locations with limited bandwidth which may cause the latest minute to become available some minutes later. Another reason may be system maintenance in which case statistics is not collected until after the service window closes.

For other purposes than sampling, it is thus a good idea to leave as much time as feasible between the requested timestamp and wall clock.

Successful Status

Code	Explanation
200 OK	Data follows
204 No content	No data available

A successful request, returns reports enclosed in `<dscdata></dscdata>` as *Content-Type: application/gzip*.

```
<dscdata>
  <array name="certain_qnames_vs_qtype" dimensions="2"
    start_time="1498118400" stop_time="1498118460">
    ...
  </array>
  ...
</dscdata>
```

Error codes

Code	404 Not found	Explanation
403	Forbidden	The site was not found
500	Internal server error	You are not authorized to access this service
		Unexpected failure. Contact provider.

sites/configured

Resource URL

```
/sites/configured
```

Method

```
GET
```

URL Parameters

None

Successful Status

Code	Explanation
200 OK	Data follows

A successful request, returns a list of site names that are *eligible* for generating statistics, as *Content-Type: application/json*. This does *not* mean that they are guaranteed to contain statistics.

```
["AMX", "AMZ", ...]
```

Error codes

Code	Explanation
500 Internal server error	Unexpected failure. Contact provider.

sites/available

Resource URL

```
/sites/available/:time
```

Method

```
GET
```

URL Parameters

Parameter	Description	Example value
time	Time asked for, in UTC	2017072212

time can be specified in two different ways:

Time format	Description	Example value
YYYYMMDDHH	Specified hour	2017072212
YYYYMMDDHHmm	Specified minute	201706221200

Successful Status

Code	Explanation
200 OK	Data follows

A successful request, returns a list of site names that have statistics for a given time, as *Content-Type: application/json*. Due to statistics collection latencies, accessing a specific timestamp may return a larger list of sites at a future point in time.

```
[ "AMX", "AMZ", ... ]
```

Error codes

Code	Explanation
500 Internal server error	Unexpected failure. Contact provider.
